You can easily allow users to search your Tiki by adding a search module. Tiki has two basic search module types:

- **search_box**: Uses the database’s internal mechanisms to index the text and perform the search
- **search_new**: Uses Tiki to index the text and perform the search.

Refer to the Tiki documentation for full details on these two types of searches.

You have already enabled the search option, now you need to configure its options.

1. From the Admin menu, click **Admin home**.
2. From the Control panels, click **Search**.

   **TIP**
   You can also access the Administration page by typing `http://www.yourdomain.com/tiki-admin.php?page=search` in your web browser.

3. The Administration: Search page appears.

4. On the **General Settings** tab, enable the following options:
   - **Unified Search Index**: Enable by default.
   - **Search statistics**: Specifies that Tiki should record each search term that users query.
   - **Unified search index**: MySQL full-text search
   - **Referrer Search Highlighting**: Tiki will highlight each search match in the resulting pages.

   Leave the other options as their defaults.

5. Click the **Search Results** tab to specify what options Tiki will include on the results page.

6. In the **Items to display in search results** area, enable the **Object filter** option. This will allow users to filter their search results by Tiki object (that is, show only wiki pages, or articles, or trackers, etc.)
7. Click **Apply**. Tiki saves the information and reloads the page.

Now that you have configured the search options, you can add the search module to your site.
